An Odd Collision Tumor – Dermatofibroma Plus Nevus

ABSTRACT – A cutaneous collision or contiguous tumor occurs when two or more cutaneous tumors coexist in a single lesion. These tumors usually have misleading clinical and histological presentations, making them a diagnostic challenge. Although several different combinations of collisions have been described we report an unusual case of a cutaneous collision tumor on the back of the patient involving an intradermal naevus and a dermatofibroma. To the best of our knowledge, this is the first time such combination is reported.

KEY-WORDS – Tumor, Collision; Dermatofibroma; Intradermal, Nevus.
although basal cell carcinoma as well as subnevic folliculitis could not be excluded, since the progression of the lesion was unknown by the patient. On dermatopathology (Fig. 2) the coexistence of two commonly seen cutaneous lesions, a dermatofibroma and an intradermal nevus were observed.
